I CLAIM:

1	1. A contact assembly for a contact blade, the
2	assembly comprising
3	two outer sheet-metal combs of generally identical
4	shape and each unitarily formed with
5	a longitudinally throughgoing base strip lying in
6	a respective base plane and having a pair of
7	longitudinal edges and
8	a plurality of forks each having a pair of contact
9	arms projecting transversely from one of the
10	edges of the respective base strip generally
11	parallel to each other and to the respective
12	base plane, the arms of each fork being
13	spaced transversely of the respective base
14	plane from each other and defining a mouth
15	open parallel to the respective base plane
16	away from the respective one edge,
17	the base strips being transversely juxtaposed with the mouths
18	aligned and forming a blade-receiving slot open parallel to the
19	base planes and with the forks of one of the combs interleaved
20	with the forks of the other of the combs.

- 2. The contact assembly defined in claim 1 wherein one of the combs is formed with a plurality of contact tabs projecting from the other of the edges of the respective base strip.
- 3. The contact assembly defined in claim 2 wherein the contact tabs project generally perpendicular to the respective base planes.
- 1 4. The contact assembly defined in claim 1 further comprising
- a middle sheet-metal comb generally identical to the first inner combs and sandwiched therebetween with the forks of the middle comb interleaved with the forks of the outer combs.
- 5. The contact assembly defined in claim 4 wherein the outer combs are both formed at their other edges with contact tabs.
- 6. The contact assembly defined in claim 4 wherein the outer combs are mirror symmetrical to each other.

- 7. The contact assembly defined in claim 1 wherein the
- forks lie in respective fork planes extending generally
- perpendicular to the respective main planes.

longitudinal edge.

- 8. The contact assembly defined in claim 1 wherein each of the combs is unitarily formed with respective twisted webs extending between the forks and the respective one
- 9. The contact assembly defined in claim 8 wherein the forks each include a base web between the respective arms and the respective twisted webs and the twisted webs extend offcenter from the respective base webs.
- 10. The contact assembly defined in claim 1 wherein
 the base strips are each formed between the forks with
 throughgoing weakening apertures, whereby the base strips can
 easily be cut at the apertures.

- 11. The contact assembly defined in claim 1, further
- 2 comprising
- means fixing the base strips to each other.
- 1 12. The contact assembly defined in claim 1 wherein
- the base strips and fingers are of the same thickness.

1	13. A contact assembly for a contact blade, the
2	assembly comprising
3	two outer and one middle sheet-metal combs of similar
4	construction and each unitarily formed with
5	a longitudinally throughgoing base strip lying in
6	a respective base plane and having a pair of
7	longitudinal edges,
8	a plurality of forks lying in respective base
9	planes perpendicular to the base planes and
10	each having a pair of contact arms projecting
11	transversely from one of the edges of the
12	respective base strip generally parallel to
13	each other and to the respective base plane,
14	the arms of each fork being spaced
15	transversely of the respective base plane
16	from each other and defining a mouth open
17	parallel to the respective base plane away
18	from the respective one edge, and
19	respective twisted webs connecting the respective
20	forks with the respective one edge,
21	the base strips being transversely juxtaposed with the mouths
22	aligned and forming a blade-receiving slot open parallel to the
23	base planes and with the forks of one of the combs interleaved
24	with the forks of the other of the combs.
